Scoped Use-Case Assistant Guide

Working with the single-dataset analytics assistant · Knowledge base v1.0

1. The scoped model

This assistant is deliberately limited to one governed use case: a single dataset with its associated deployed models and decisions. The scope is configured on the server and reported by the assistant itself — ask it what it covers. Questions outside the scope are declined by design; this is a governance feature, not a malfunction.

2. What you can ask

Category	Examples
Explore	“What columns does the dataset have?” “Show 10 sample rows.” “How complete is the amount field?”
Analyze	“Total by category for Q2.” “Trend of monthly volumes.” “Top 10 by value with their share.”
Visualize	“Chart approvals by week as a line.” “Bar chart of spend by supplier.”
Score	“Score this record against the deployed model.” “Which decision would case X get?”
Model	“Build a model predicting the target with AutoML and show the leaderboard.”

3. Answer conventions

- Every figure carries its filter context and row counts.
- Samples are samples — the assistant will not present a 10-row preview as the full dataset.
- SQL/SAS code used for an answer is available on request for reproducibility.
- Charts accompany, not replace, the stated numbers.

4. Limits

No access to other datasets, systems, or the wider Viya estate; no row-level exports outside governed channels; destructive operations (like deleting an ML project) require explicit confirmation of the named object.
