# Data & Reporting Standards

Naming conventions, KPI definitions, and reporting rules for the analytics environment · Knowledge base v1.0

## 1. Naming conventions

- CAS tables: UPPER_SNAKE_CASE with a domain prefix — PROC_ (procurement), FIN_ (finance), OPS_ (operations), REF_ (reference data). Example: PROC_SUPPLIER_MASTER.
- Suffix _YYYY or _YYYYMM marks period snapshots; unsuffixed tables are current-state.
- Reports: ' — ()', e.g. 'Procurement — Supplier Spend (Management)'.
- AutoML projects: __.

## 2. KPI definitions

| KPI | Definition |
|---|---|
| Supplier concentration | Share of category spend held by the top 5 suppliers over the trailing 12 months. Amber above 60%, red above 75%. |
| Maverick spend rate | Percentage of spend executed outside framework contracts. Target below 10%. |
| Payment cycle time | Median days from invoice receipt to payment. Standard cycle 30 days; payments in under 7 days require an exception reason. |
| Single-bid rate | Percentage of competitive tenders receiving one valid bid. Investigate categories above 20%. |
| Model score (fraud/risk) | Probability 0–1 from the deployed champion model; operational threshold 0.72 unless the decision flow specifies otherwise. |

## 3. Reporting rules

- All amounts in AED unless stated; conversions use month-end central-bank rates.
- Reporting periods follow the fiscal calendar (January–December); week starts Monday.
- Comparisons default to same period last year; month-over-month only for operational metrics.
- Row-level data leaves the platform only via governed exports; aggregate before sharing.

## 4. Data quality gates

A table is reporting-grade when: load timestamp within the agreed freshness window; key completeness at 99% or better on declared business keys; and no schema drift against the registered definition. The assistant should state when a queried table fails a gate.
