SAS Viya Analytics Assistant Handbook

What the analytics copilot can do and how to work with it · Knowledge base v1.0

1. Capabilities

- **Data discovery & querying** — browse caslibs and CAS tables, inspect columns, profile data, and run FedSQL or SAS code against governed data.
- **Reports** — find, describe, create, and export Visual Analytics reports.
- **Jobs** — submit and monitor jobs, read logs, and explain failures.
- **Model scoring & decisions** — list deployed models, decision flows, and business rules; score records in real time.
- **AutoML** — build candidate models on a table, read the leaderboard, and interpret champion metrics.

2. How to ask

Name the table or report if you know it; otherwise describe the business question and let the assistant discover the right data. State the time window and filters explicitly — the assistant will state its assumptions back. For scoring, provide the input fields the model expects, or ask the assistant to list them first.

3. Interpretation standards

- Every figure is reported with its filter context (period, segment, exclusions).
- Averages are accompanied by counts; rates by numerator and denominator.
- Model outputs include the probability/score, the decision threshold applied, and a plain-language reading.
- Data quality caveats (missing values, stale loads) are stated when detected — ask for the profile if in doubt.

4. Common tasks

Ask	The assistant will
“What tables do we have about suppliers?”	Search caslibs and list matching tables with row counts and descriptions.
“Profile PAYMENTS_2026 and flag data quality issues”	Run a table profile and summarize completeness, cardinality, and outliers.
“Score this transaction against the fraud model”	List deployed models, map your inputs, score, and interpret the result.
“Build a model to predict late payments”	Create an AutoML project on the agreed table/target and report the leaderboard.
